Power Generation

The Challenge:

An energy supply company in Abu Dhabi started a unique strategic energy initiative involving production and processing of natural gas from Qatar's offshore North Field. The processed gas was transported by subsea pipeline to the UAE. This resulted in two integrated drilling and production platform complexes.

What provides the best protection against corrosive sour gas that is prevalent in Qatar's offshore North Field?

The Solution:

A higher degree of corrosion protection was reached with specially manufactured A-LOK® fittings...

Parker Instrumentation's A-LOK tube fittings were specified for the offshore platforms and gas processing plant. As well as fittings fabricated from conventional 316 stainless steel, Parker manufactured fittings using Hastelloy and 6Mo alloys. These exotic materials provide a high resistance to pitting and crevice corrosion as well as high strength compared with conventional austenitic stainless steels and ensuring system integrity and a long lifecycle.
