DIFFERENTLY**

# Innovations

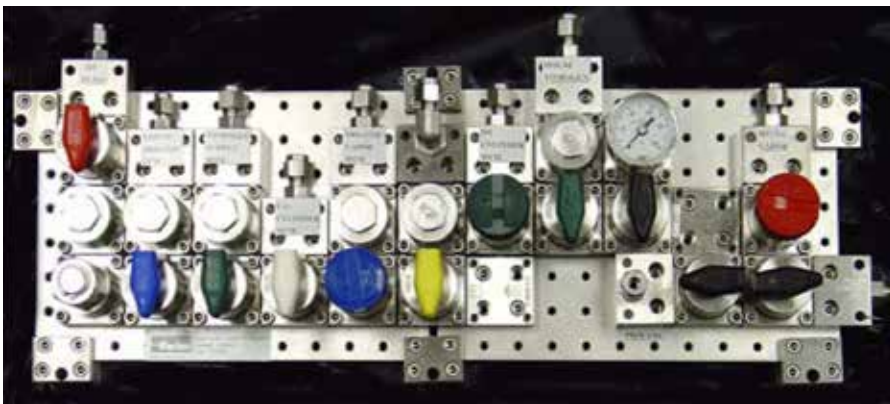

## Chemical / PetroChem

### The Challenge:

A global company has research and development centers for Specialty Materials worldwide, located in Germany, Illinois, Virginia, California, New Jersey and New York. They are a global leader in providing customers with high-performance specialty materials, including fluorocarbons, specialty films and additives, advanced fibers and composites, customized research chemicals and electronic materials and chemicals.

Their Buffalo, NY location had a problem with pre-assembly of an entire manifold with fittings and tubing prior to installation.

### The Solution:

**Provide better actuation and more precise, controlled results...**

Parker's IntraFlow™ modular system replaced the previous system. The Intraflow unit controls multiple feeds of various chemicals into a chemical research reactor and combines all streams into this single chemical reactor with individual stream control.
