These assemblies are designed and tested for today's new alternative fuels: Compressed Natural Gas (CNG), Liquid Natural Gas (LNG) and Liquid Propane Gas (LPG). CNG, LNG and LPG have the same problems that plague diesel and gasoline, particulate contamination collects during handling, water condenses in tanks, and compressors leak oil into the fuel stream.

The precision components necessary for the efficient operation of an alternative fuel system demand superior filtration. Racor anticipated the need for ultra-fine filtration at the pressures required by compressed

natural gas. The answer is the industry's first, most complete and most efficient line of alternative fuel filters/coalescers.

FFC series filters are designed to protect critical engine components in CNG, LNG, and LPG powered vehicles. Contaminants can be introduced into a vehicle's fuel tank when being fueled or may come from compressors and/or storage facilities. A grade 6 coalescing filter is specifically designed to remove oil, water, and solid contamination from compressed natural gas. The patented coalescing filter removes 99.97% of all aerosols in the 0.3 to 0.6 micron range.

These fuel filter/coalescer elements are produced by a patented process of arranging micro-glass fibers into a tubular form. During operation, fuel is forced through the coalescing media from the inside of a cartridge through a tubular wall to the outside, where large droplets fall to the bottom of the housing. Oily water emulsion accumulates until drained while dirt particles remain trapped and collect on surfaces of fibers.

| Temperature | -40°/+225° F (-40°/+107° C) | | | |

- Notes:**
1. For accurate flow rates and pressures, consult your engine manual, engine manufactures agent, or the vehicle manufacturer.
 2. Some specifications are the result of tests conducted at the optimum flow rate.
 3. Allow 3.0 in. (7.6 cm) of clearance below assembly for draining and maintenance of element.
